# ABOUT US

Portlaoise Springs is Ireland's one stop shop for all leaf spring requirements offering not just the largest range of springs but also the most in-depth knowledge and best customer service.

Established in 1987, the company has become established as Ireland's largest leaf spring distributor. The company is now under new ownership and management since 2016 and has continued to grow, through investment, extension of product ranges and new technology.

Leaf springs are a crucial component in commercial vehicles and are found on vans, trucks, buses and 4x4 vehicles. A leaf spring is the component responsible for carrying the vehicle's load.

According to CSO Road Survey Report 2017 each year in Ireland over 150 million tonnes of goods are carried by commercial vehicles over a distance of 1.6 million kilometres over 13,000 separate journeys. Every single journey taken requires the vehicle's leaf springs to support its load and deliver the goods on time. When a leaf spring breaks the vehicle can not be driven and a stationary vehicle will not generate income for its owner. This positions our company as an integral part of the Irish transport industry.

We work with three of the world's leading leaf spring manufacturers to deliver consistent OEM quality leaf springs to our wide customer base.

# SERVICES

## **SPRING & SPRING ACCESSORY SALES**

We stock over 600 different types of leaf springs and all associated parts. All springs are manufactured to original manufacturer specification.

## **SPRING REPAIR**

We offer individual components of leaf springs and also offer a spring repair/reconditioning service to our customers. This is a very effective cost cutting measure for our customers when they do not wish to buy a complete spring, we can replace the components which are broken or worn.

## **SPRING INSTALLATION**

We have a fully equipped workshop with a skilled team who install leaf springs to customers vehicles. We pride ourselves in offering a low cost, speedy service to minimise downtime of vehicles as when a truck is off the road it is not generating an income for its owners.

## **SPRING REINFORCEMENT**

We offer a reinforcement service for leaf springs. This involves strengthening the leaf spring by adding additional leaves, retempering the steel, refinishing (painting) and also removal/refitting of the spring to the vehicle. This is a very popular service for our customers.

## **SPRING DESIGN/MANUFACTURING**

We offer a bespoke leaf spring design/manufacturing service for customers with specific requirements such as vehicles with shortened bodys & vehicles for special uses such as those operating in mines and those who carry tremendous weight.

## **PARTS DEPARTMENT**

Alongside our leaf spring services we also offer a wide range of parts for commercial vehicles from braking components to engine components. Our speciality within our parts department is Hino truck parts and we are known country wide for this range with customers ranging from vehicle owners to motor factors.

## **BRAKE RELINING SERVICE**

Another service that is becoming increasingly popular is our brake shoe relining service. This involves shot blasting of brake shoes and replacement of the friction material.

## LEAF SPRINGS

What is a leaf spring?

A leaf spring is a component of some vehicles suspension systems. A leaf spring is composed of several (or sometimes just one) strips of metal, called leaves, arranged on top of each other to form a single curved pack. The bending of the leaves and the friction between them as they slide slightly over each other while bending, absorbs the vehicle's weight as well as any bumps. Most leaf springs are curved to help the spring absorb impact.

The main functions of leaf springs are to support and carry the vehicles load and to absorb impact from bumps, uneven surfaces & potholes.

A leaf spring is usually attached to the body or frame of the vehicle at each end, while the wheel or axle assembly is fixed to the middle of the spring. Usually each spring extends in the same direction as the vehicle, one on each side, with attachment points at the front and rear; a few suspension designs feature a single leaf spring attached at each side (a "transverse" spring).

## U-BOLTS

What is a U-bolt?

A U-bolt is a bolt that is threaded at both ends and is shaped like the letter "U", but can come in a round U shape, a square U shape or a semi-round U shape depending on the needs of the suspension. It is one of the major parts of the leaf spring suspension and provides a permanent tie between the spring leaves. U-Bolts go around the axle and hold the leaf spring bundle tightly on the underside of the axle.

Why should U-bolts always be replaced when changing leaf springs?

Like any bolt, the biggest problem that can happen with a U-bolt is for the nut to become loose. This is made easier by the fact that the suspension system and the U-bolts within it are constantly subjected to vibrations and jolts when you are driving. When the nuts become loose, a couple of things can happen. The first of which is that the U-bolt itself can start hitting against the axle. It is designed to be tightly held against the leaf spring, and this constant striking can lead to bolt breakage. When a u-bolt is re-used it can not be tightened fully due to thread stretching and therefore will have a very high chance of becoming loose.

## SHACKLE PINS

What is a shackle pin?

A shackle pin is a component which secures a leaf spring on both ends to the vehicle chassis. These components suffer from wear and should be replaced when changing a leaf spring.

## HOW TO CORRECTLY MEASURE A LEAF SPRING

To correctly measure a leaf spring there are four key measurements to be taken:

### Length A

Measure from centre of front spring eye to centre of centre bolt along the curved surface of the leaf. Never measure straight across as this is not accurate.

### Length B

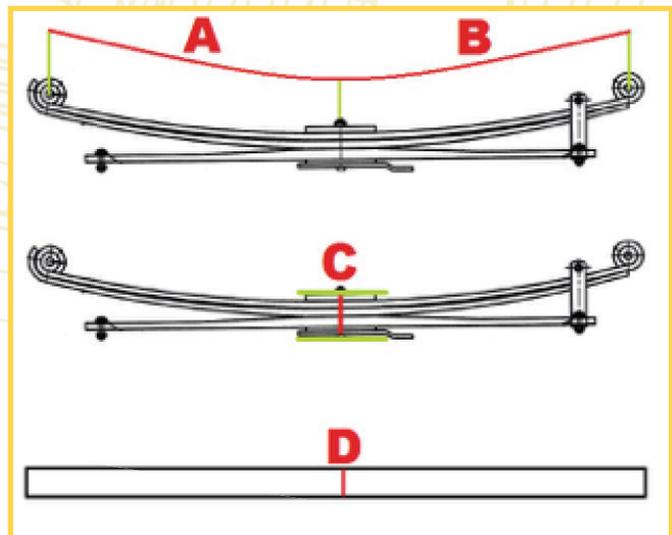

Measure from centre of rear spring eye to centre of centre bolt along the curved surface of the leaf. Never measure straight across as this is not accurate.

### Thickness C

Measure total thickness of spring at centre from top to bottom including plates if relevant.

### Width D

Measure the width of the main leaf at centre.

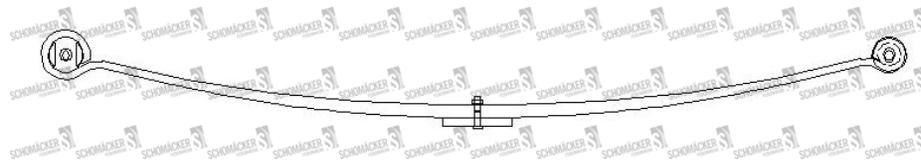

**Please note that measurements of width and thickness should be taken with a vernier calipers and length is most easily and accurately measured with a steel ruler as opposed to a measuring tape.**
